## 5.2 The cube model - dimensions, attributes, measures

*This section is non-normative.*

A statistical data set comprises a collection of observations made at some points across some logical space. The collection can be characterized by a set of dimensions that define what the observation applies to (e.g. time, area, gender) along with metadata describing what has been measured (e.g. economic activity, population), how it was measured and how the observations are expressed (e.g. units, multipliers, status). We can think of the statistical data set as a multi-dimensional space, or hyper-cube, indexed by those dimensions. This space is commonly referred to as a *cube* for short; though the name shouldn't be taken literally, it is not meant to imply that there are exactly three dimensions (there can be more or fewer) nor that all the dimensions are somehow similar in size.

A cube is organized according to a set of *dimensions*, *attributes* and *measures*. We collectively call these *components*.

## Observations can feed into models (Keytah)

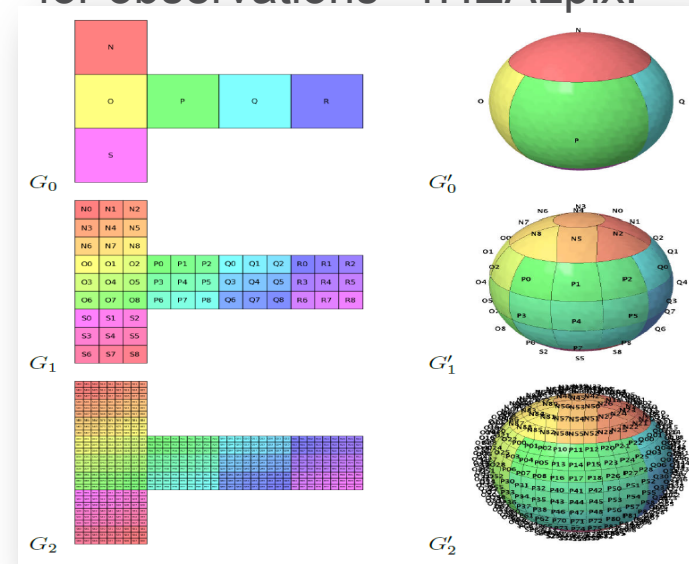

# Next step? A multi-scale, observational framework

An Australian nested grid system for observations:

A discrete global grid system for observations - rHEALpix:

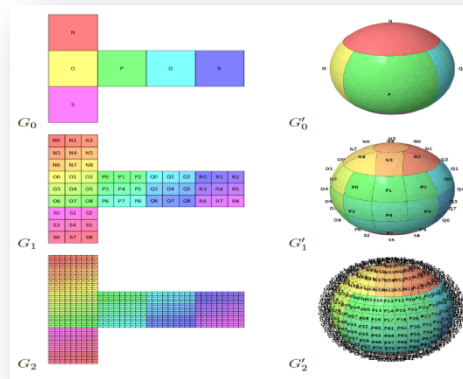

# Extracting information from EOS – ultimate vision

Numerous EOS  
data  
sources

Calibrated land surface  
measurements in a  
Global observing grid

Information for  
multiple uses in  
land, water,  
hazards, & etc.

## Conclusions

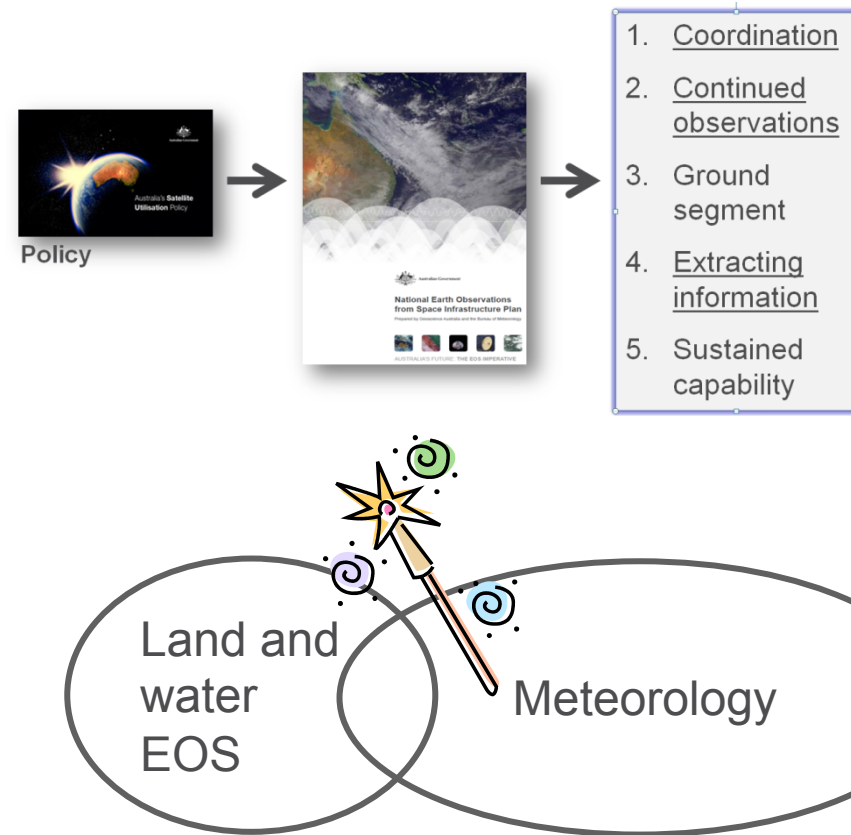

A clear policy and planning framework

Coordination

Defined priorities

Exciting progress

Increasing opportunities in the overlap between land and atmosphere communities of EOS

# Thank you.
