

# Monitoring the Data Quality and Stability of the FY-3 Sounders and Microwave Imager

**luqf@cma.gov.cn**

Qifeng Lu , Ran You, Chengli Qi, Songyan Gu, Hu Yang,  
Jun Yang, Peng Zhang, Zhongdong Yang, Naimeng Lu, Chaohua Dong,  
and whom from ECMWF, Met Office and Met France

National Satellite Meteorological Center ,CMA  
4th Asia-Oceania Meteorological Satellite Users Conference  
Oct 9-11, 2013, Melbourne, Australia

# Outline

- Initial FY-3A data quality assessment at ECMWF
  - (OBS – Modelled  $T_B$ ) for FY-3A & comparison with MetOp & Aqua
  - Initial Assimilation Experiments
- Characterising the FY-3A MWTS (Optimizer for Instrumental Parameters On-orbit)
  - Passband Uncertainties & Non-linearity Effects
  - Improved Assimilation of MWTS
  - Improved MSU/AMSUA
- Initial Assessment of FY-3B

# The FY-3A/B Instrument Suite

Infrared  
Atmospheric Sounder  
(IRAS)  
20 channels  
(~HIRS/3)  
**Microwave  
Temperature  
Sounder (MWTS)**  
**4 channel (~MSU)**  
Microwave  
Humidity  
Sounder (MWS)  
5 channel (~MHS)

Microwave  
Radiation Imager  
10 channels  
(~AMSR-E)

# Initial Data Quality Assessment : General Approach

- Approach involves a comparison of observations (OBS) with simulated observations based on short range (up to T+9 hour) forecast fields ('First Guess', FG) and radiative transfer modelling → 'FG departures'
- FG is 'proxy' for truth 'FG departures' (OBS – FG) indicate error in the measurements or RT modelling
- High accuracy of the NWP fields results from the large & diverse range of observations assimilated (MW sounders, Advanced IR sounders, GPSRO, radiosondes ... etc)
- Able to detect biases at ~0.1K level for temperature sounders (MWTS and IRAS), sensitivity slightly lower for MW humidity sounders & imagers (~0.5K)
- Similar work ongoing at NOAA/NCEP, UK Met Office, DWD and JMA

# Initial Data Quality Assessment at ECMWF: Comparison of FY-3A with MetOp & Aqua

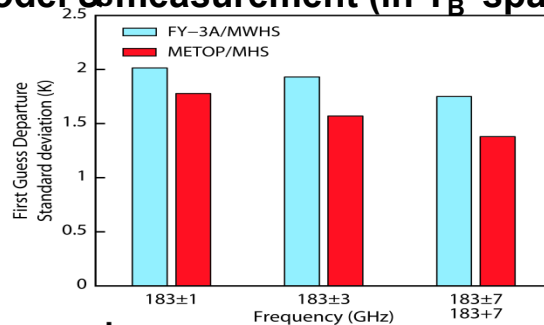

STDEV (first guess departures):

measures the misfit between model & measurement (in  $T_B$  space)

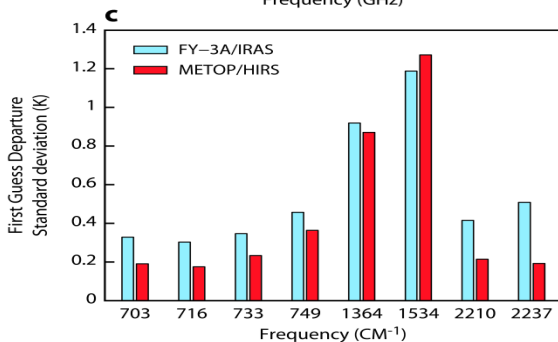

Microwave  
Temperature

Imager

**FY-3A data quality  
is comparable  
with MetOp/Aqua  
equivalents**

# Initial Data Quality Assessment at ECMWF: Assimilation Experiments

positive  
impact  
from FY-3A

The impact of the  
FY-3A data is :

**Full System OSEs:**  
**Full System + FY-3A VASS suite (MWTS, MWHS, IRAS)**  
**T511, 3 month experiment**

- neutral in SH
- slightly positive in the NH

# Characterize the MWTS

## Schematic of error terms

# Optimize the instrumental parameters

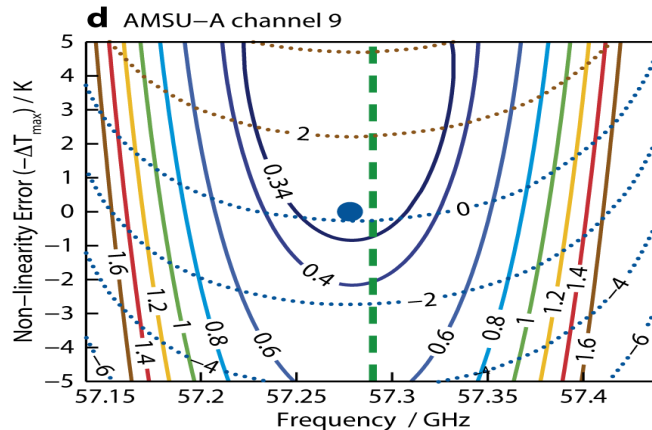

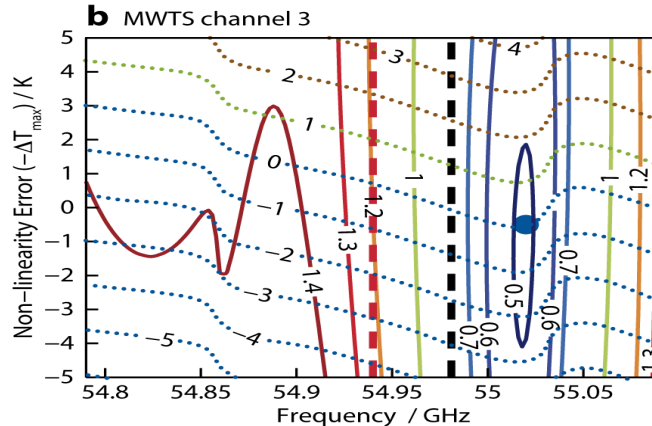

departures are shown in Fig. 9. Because both factors are important in constraining the optimal estimate of the instrument parameters these were combined in an empirical penalty function  $J(\Delta v_0, \Delta T_{\max})$ , as

$$J(\Delta v_0, \Delta T_{\max}) = \frac{m(\Delta v_0, \Delta T_{\max})^2}{\sigma_m^2} + \frac{s(\Delta v_0, \Delta T_{\max})^2}{\sigma_s^2}, \quad (6)$$

where  $\sigma_m$  and  $\sigma_s$  are chosen to represent our estimate, based on an educated guess, of the uncertainties in the expected residual bias and tolerable increase in standard deviation relative to the absolute minimum obtained

**STD of 0.2 K is normally monitored**

# Optimizer of Satellite Instrumental Parameters On-orbit (OSIPOn)

# **Initial results from an evaluation of MSU and AMSUA from 1978**

# MSU CH3 (54.96 GHz): NOAA-6 to NOAA-14

- LbL modelling based on ERA-Interim fields
- 1 cycle per month: 1979 -2011

# **Initial FY-3B Evaluation**

## FY-3B MWTS FG Departure Channel 3: 54.072 GHz

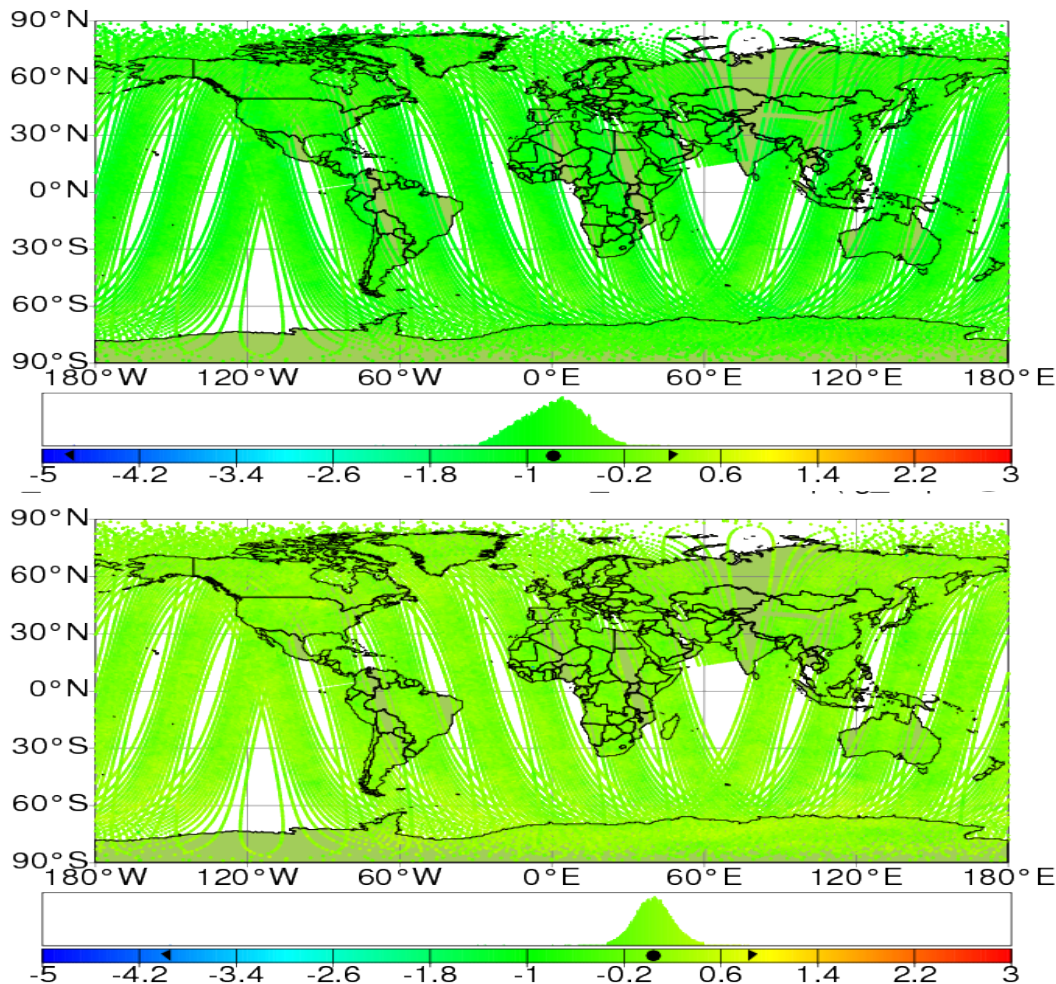

- Correction of passband measurement bias and radiometer non-linearity has been implemented in pre-processing at NSMC/CMA

- No significant problems with the MWTS-2 and -3 observations

- Cross scan bias is dominant & accounts for non-gaussian FG departures (corrected by variational bias correction scheme):

After VarBC

STDEV(O-FG) = 0.17 K

- Control + IRAS
- Control + MWHS
- Control + MWTS
- Control, Full system

# Update for MWTS and MWHS from FY-3C

- MWTS is extended from 4 to 13 channels with 90 scanned points;
- MWHS is extended form 5 to 15 channels with 8 channels near 118 GHz and another 2 channels near 183 Ghz

We are still improving the tool, OSIPOn, to characterize the instrumental performance, hopefully the Fengyun satellite would be even better.

# Summary

- FY-3A data has been evaluated at ECMWF through a comparison with simulated radiances & full assimilation experiments in which FY-3A data is introduced in the ECMWF system.
- A detailed study of the FY-3A revealed, and corrected, biases in MWTS related to :
  - Uncertainties in the passband centre frequencies
  - Radiometer non-linearities
- These corrections bring the MWTS data close to the quality of equivalent AMSU-A data & in assimilation experiments this MWTS data delivers improvements in forecast accuracy.
- Initial assessment of FY-3B suggests the data is comparable with its counterpart.
- The high values of **OSIPOn** in Cal/Val of new satellite sensors has been clearly demonstrated – the improved FY-3 data would be expecting to contribute more to the NWP community.
